

**Directions:**

Nematodes are live insect parasitic worms that will not infect humans, pets or plants. Each species/product is specific to the host and is only effective when the host is in the grub or larval stage. The nematodes are contained in the small plastic bag inside the paper bag. Once combined with water and activated the nematodes must be used within 4 hours. Care must be given to the storage and application of these creatures to ensure optimum effectiveness. Please follow the directions carefully. ***Apply to moist soil out of direct sunlight.***

**Nematode Preparation**

Remove and open plastic bag from inside paper pouch. Mix contents into 600ml of room temperature water. This is your ***nematode solution.***

**Broadcast application with watering can – For areas up to 1000 sq feet**

1. With a spoon or stick, mix nematode solution prior to each draw from the syringe
2. Insert tip of the syringe into the solution and pull back plunger to fill the syringe completely. Add contents of syringe solution to standard 2.5 gallon watering can.
3. Fill remainder of watering can with clean water and stir.
4. Apply to areas of infestation. Each watering can should cover about 170 sq feet.
5. Repeat steps 1 and 2 until all solution is used up.
6. Using a sprinkler or hose thoroughly water; maintain soil moisture for 2-3 weeks.

**Broadcast application with Backpack Sprayer - For areas up to 1000 sq feet**

1. Remove any fine mesh or sand filters from backpack sprayer.
2. Add 300ml of nematode solution to standard 5 gallon back pack sprayer.
3. Fill the remainder of the sprayer with fresh water. Mix thoroughly.
4. Set nozzle to mist
5. Spray infested areas of turf – up to 500 sq feet.
6. Repeat steps 2-5 onto the remaining 500 sq feet of infested turf.
7. Follow up the application with a thorough saturation of fresh water.
